Better claim reports. Less work at intake.

MANAGEMENT SUMMARY

Accident Tool guides policyholders from the accident scene to a submitted claim report. The app and browser report capture details, photos and signatures in a structured format. Your company receives a readable report by email or structured data through the partner API. This supports fewer follow-up enquiries, less rekeying and a faster start to claims handling.

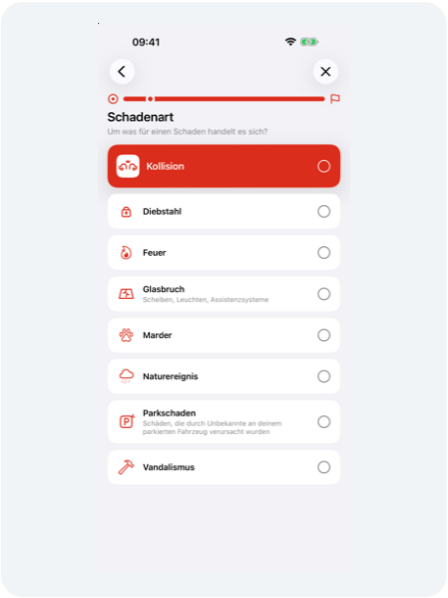
No subscription

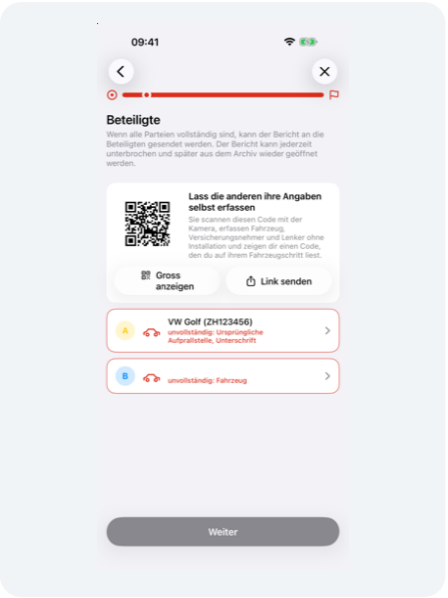
Entry without ongoing commitment

From the accident scene into your claims process



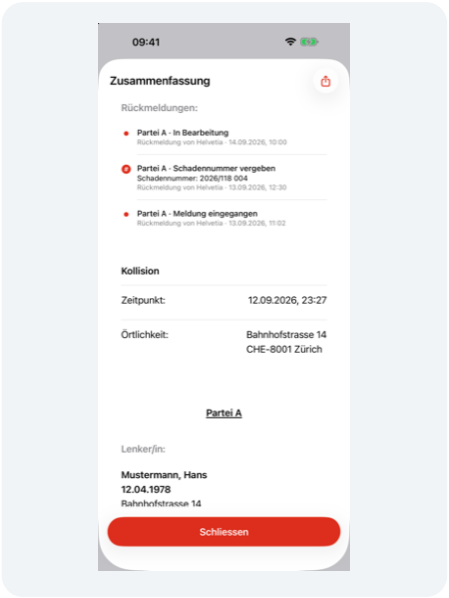
01 Guided capture

Select the claim type; document the location, photos and circumstances.



02 Complete together

Other party provides data via QR code, App Clip or browser.



03 Stay informed

Submit the report; view updates from connected insurers.

Original App 2.53 screenshots in German, using practice and sample data.

Your benefit: less data entry, clearer documentation and greater transparency for policyholders.

What your insurance company gains

Structured reporting	Collision and other claims; since 2.55, an additional object party such as a guardrail. Photos, sketch, initial impact point and signatures.	A stronger basis for review; fewer missing details.
Less typing	Reuse profiles, scan ID cards, transfer personal and vehicle data via QR code.	Less duplicate entry and fewer transcription errors.
Cross language barriers	29 languages; PDF in recipient language; delivery to Green Card representatives in the country where the accident occurred.	Consistent intake, including cross-border claims.
Inform customers	Copy of report, claim number and status per party; push notification upon request. Specific additional requests via your own contact channel.	Potential for fewer status inquiries and more transparency.
Involve partners	Identified repair/glass partners, partner links and fleet QR codes. Insurer-specific claim catalogue managed via API; QR cards for policyholders.	Your partner network is visible when a claim occurs.

A distinctive combination

Involve the other party without an installed app + multilingual data capture + international delivery + updates for each party. QR profile data passes directly between devices, without server transfer.

Start simply. Expand in controlled steps.

Email reports are free. The API requires a contract: each report made available is billed, not each retrieval. Test with practice reports, run in parallel if required, then switch fully. Agree integration work separately.

Personal data is stored encrypted in Germany. The retention period is 30 days; the daily deletion job removes expired content within approximately 31 days. Import reports into your own system in time. Local copies remain; status updates are specific to each party.

Measure pilot results

Time: manual entry minutes per case | Quality: cases needing no follow-up
Service: status enquiries per case | Speed: time to registration

Calculation example, not a forecast: 1,000 cases × 5 minutes saved = around 83 hours. At CHF 80 per hour: around CHF 6,667 gross work value, before project and operating costs. Check savings in the pilot compared to comparable previous cases.

Next step: Walk through a claim in a short demo and agree the pilot scope and success criteria together.
