

Friday. 5:42 pm.

Almost there. Then it happens.

A minor rear-end collision abroad.
No paper. No shared language.

Digital accident reporting, right where it happens.

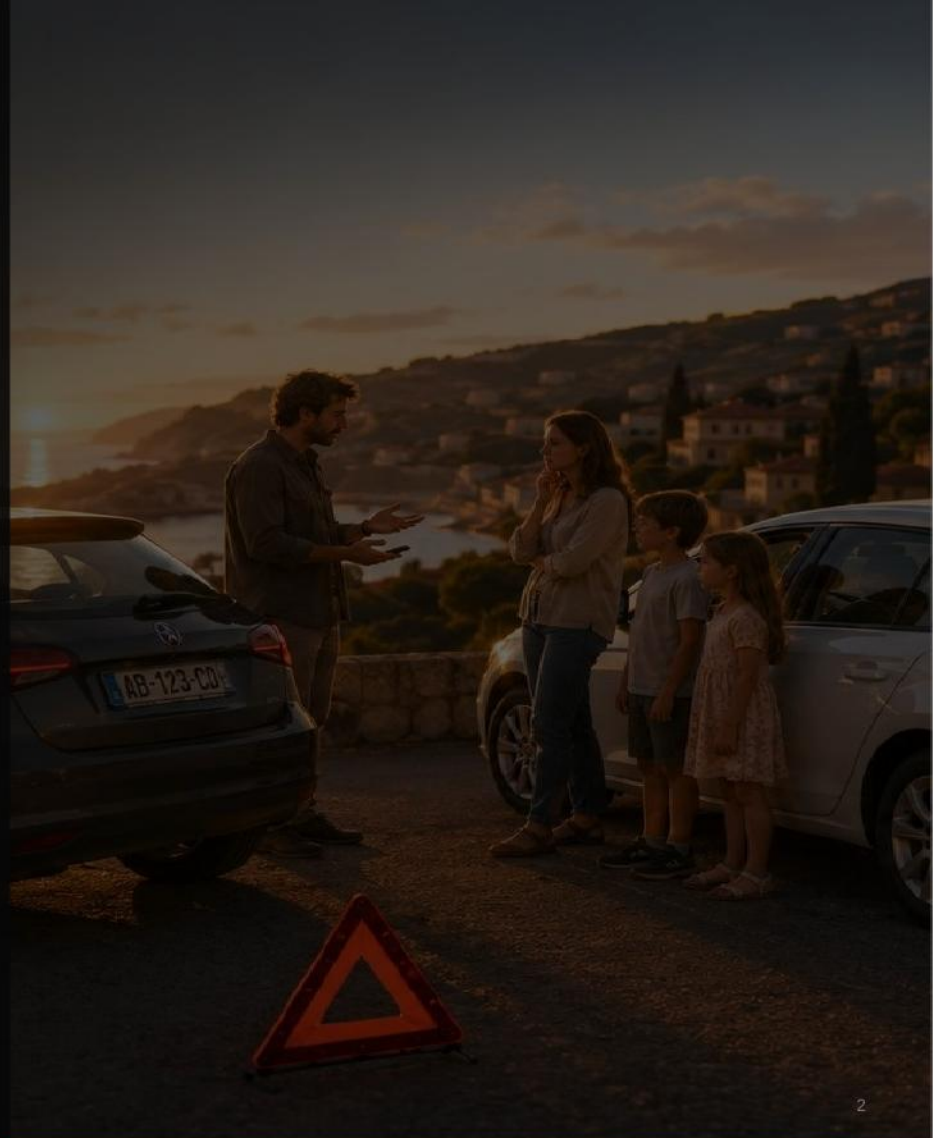

Today's reality.

**No paper.
No shared language.**

After an accident, the process is often fragmented:

- Gather information
- Overcome language barriers
- Document damage clearly
- Involve the insurer and partners

This is exactly where Accident Tool comes in.

That's what Accident Tool is for.

Guided. Multilingual. With you throughout.

The app guides you through the report step by step. Damage type, safety, police, location and parties follow a clear sequence.

Matched to cover

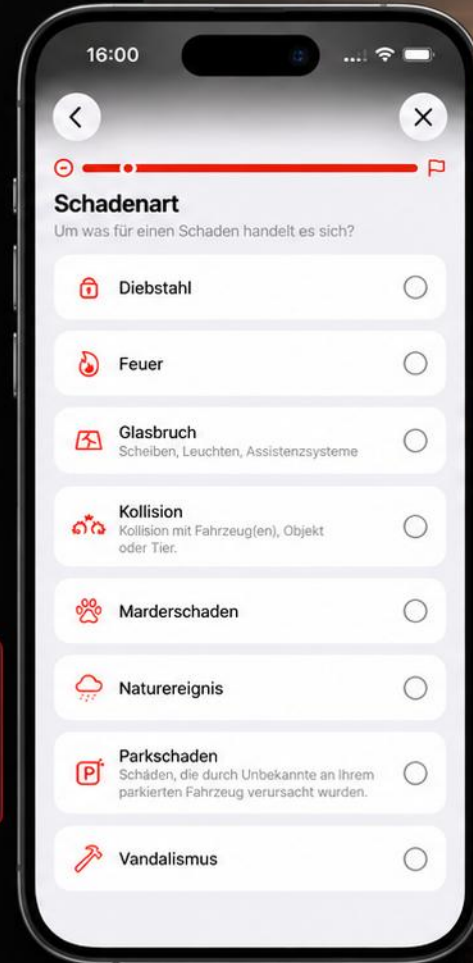

The damage types shown depend on the insurance cover stored.

Practice mode

Try the entire process without sending a report.

Special cases

Parking damage under liability cover and collisions involving people are correctly represented.

Prepare once. Reuse your data.

Data can be prepared, reused and selectively imported.

Profile

Prepare personal, vehicle and insurance details and reuse them for new claims.

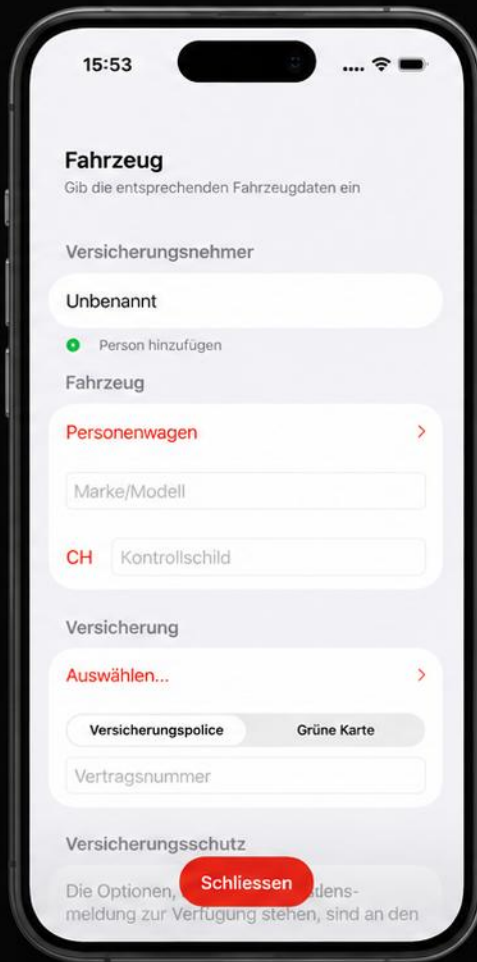

QR between parties

Selected personal and vehicle details can be transferred to a second app via QR code.

Fleets & rental vehicles

Prepared vehicle data can be imported quickly using QR codes.

Personal details

Location, time and conditions are part of the claim.

The accident location is recorded on the map. The address and time are assigned to the claim.

Location

Map-based recording of the accident location and address.

Weather & light

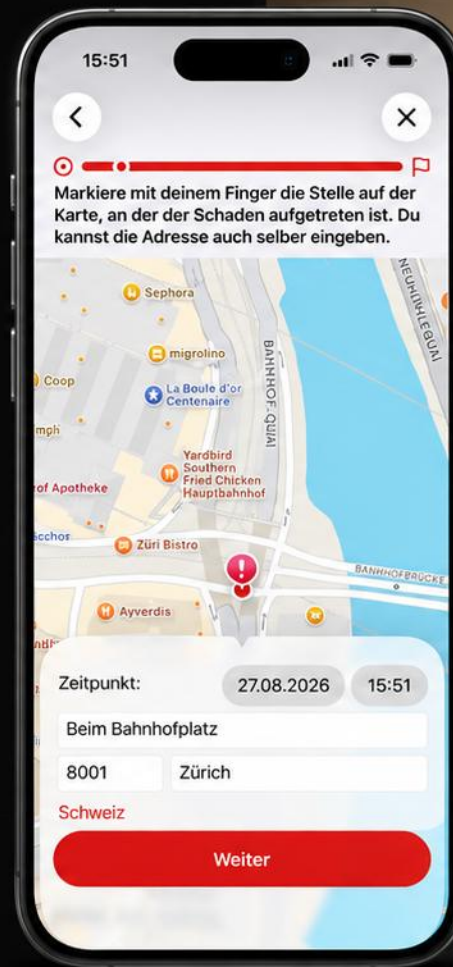

Conditions relate to the actual time of the accident, even if recorded later.

Time reference

The accident time and signature time are transmitted as structured data.

Photos

Damage photos complement the documented situation.

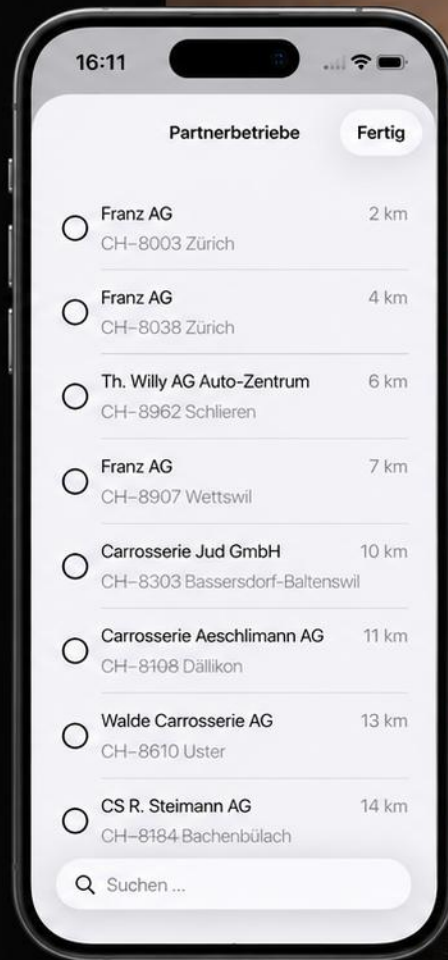

The next step is already part of the process.

If repairs are needed, the app shows suitable repairers by distance.

- The insurer's preferred repairers are marked
- Other repairers remain visible too
- Search by name, street, town and postcode

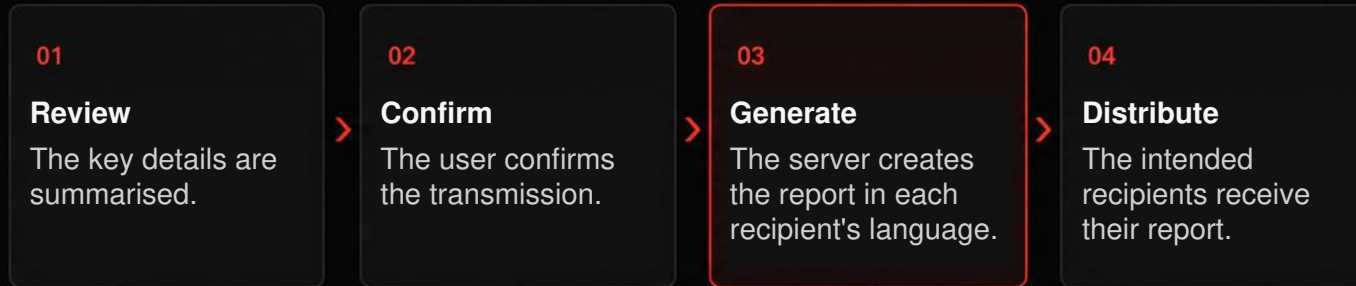

Direct customers to partners while keeping the driver's choices visible.

Repairers by distance

Confirm. Submit. Distribute.

The app does not send emails itself. The claim is handed to the server only after confirmation.

Once transmission is complete, personal data is deleted from the server.

Confirmation before transmission

The actual generated document comes back.

The report generated by the server is saved on the device and remains available in the archive.

PDF in the archive

The exact document generated remains available on the device.

Mistra-XML

Structured data can be shared from the archive.

Delivery status

The archive shows which parties could not be reached by email.

No permanent file

WEBish does not keep a permanent accident file containing personal data.

Archive of completed reports

Report before completion

Ready across Europe.

International claims need reliable insurance data and the right contacts.

2'008

Green Card

Claims representatives for foreign vehicles are also supported.

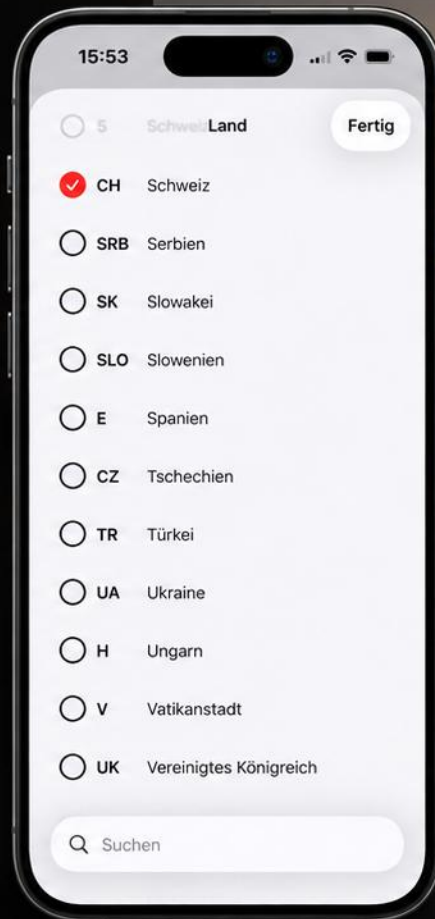

Guarantee fund

Cases involving unidentified vehicles can also be recorded.

Broker

A broker can be selected instead of an insurer.

As of September 2026

Structure instead of rework.

The value comes from a consistent digital claims process, rather than a single feature.

- **Structured data**

Guided reporting instead of free-form paper forms.

- **Recipient's language**

Reports are generated to suit each recipient.

- **Partners in the process**

Preferred repairers can be visibly integrated.

- **PDF + XML**

A readable document and structured data for further processing.

- **Customisation**

Branding, information content and integrations can be extended.

A shared foundation for customers, insurers and partners.

The next step

Demo and pilot.

Beyond theory. Let's test what works together in a real process.

- 01 **Demo**
- 02 Requirements & processes
- 03 Branding & integrations
- 04 Prepare the pilot
- 05 Run & evaluate the pilot
